Omnidirectional light propagation

Mode expansion modeling of omnidirectional light propagation ?

Directions x and z deserve the same treatment.

QUEP: An eigenmode expansion scheme that implements that constraint.

Outline

- Quadridirectional mode propagation:
 - Problem setting
 - Eigenmode expansion
 - Algebraic procedure
- Numerical results:
 - Gaussian beams in free space
 - Bragg grating
 - Waveguide crossing
 - Square resonator with perpendicular ports
 - Photonic crystal bend

Problem setting

- 2D problem, Cartesian coordinates x, z , TE / TM polarization.

Problem setting

- 2D problem, Cartesian coordinates x, z , TE / TM polarization.
- Piecewise constant, rectangular refractive index distribution; linear, lossless materials.

Problem setting

- 2D problem, Cartesian coordinates x, z , TE / TM polarization.
- Piecewise constant, rectangular refractive index distribution; linear, lossless materials.
- Fixed frequency simulations, vacuum wavelength $\lambda = 2\pi/k$.

Problem setting

- 2D problem, Cartesian coordinates x, z , TE / TM polarization.
- Piecewise constant, rectangular refractive index distribution; linear, lossless materials.
- Fixed frequency simulations, vacuum wavelength $\lambda = 2\pi/k$.
- Rectangular interior computational domain, influx & outflux across all four boundaries, external regions are homogeneous along x or z .

Problem setting

- 2D problem, Cartesian coordinates x, z , TE / TM polarization.
- Piecewise constant, rectangular refractive index distribution; linear, lossless materials.
- Fixed frequency simulations, vacuum wavelength $\lambda = 2\pi/k$.
- Rectangular interior computational domain, influx & outflux across all four boundaries, external regions are homogeneous along x or z .
- Assumption $E_y = 0$, $H_y = 0$ on the corner points and on the external border lines is reasonable for the problems under investigation.

Modal basis fields

Basis fields,
defined by Dirichlet boundary conditions $E_y = 0$ (TE) or $H_y = 0$ (TM):

Horizontally traveling eigenmodes:

M_z profiles	$\psi_{s,m}^d(x)$
and propagation constants	$\pm\beta_{s,m}$

of order m , on slice s ,
for propagation directions $d = \text{f, b}$,

Modal basis fields

Basis fields,
defined by Dirichlet boundary conditions $E_y = 0$ (TE) or $H_y = 0$ (TM):

... and vertically traveling fields:

M_x profiles	$\phi_{l,m}^d(z)$
and propagation constants	$\pm\gamma_{l,m}$

of order m , on layer l ,
for propagation directions $d = \text{u, d}$.

Eigenmode expansion

Ansatz for the optical field,

for $z_{s-1} \leq z \leq z_s$, $s = 1, \dots, N_z$,

and $x_{l-1} \leq x \leq x_l$, $l = 1, \dots, N_x$:

$$\begin{pmatrix} \mathcal{E} \\ \mathcal{H} \end{pmatrix} (x, z, t) = \text{Re} \left\{ \sum_{m=0}^{M_z-1} F_{s,m} \psi_{s,m}^f(x) e^{-i\beta_{s,m}(z - z_{s-1})} \right. \\ + \sum_{m=0}^{M_z-1} B_{s,m} \psi_{s,m}^b(x) e^{+i\beta_{s,m}(z - z_s)} \\ + \sum_{m=0}^{M_x-1} U_{l,m} \phi_{l,m}^u(z) e^{-i\gamma_{l,m}(x - x_{l-1})} \\ \left. + \sum_{m=0}^{M_x-1} D_{l,m} \phi_{l,m}^d(z) e^{+i\gamma_{l,m}(x - x_l)} \right\} e^{i\omega t}.$$

Eigenmode expansion

Mode products \leftrightarrow normalization, projection:

$$(\mathbf{E}_1, \mathbf{H}_1; \mathbf{E}_2, \mathbf{H}_2)_x = \frac{1}{4} \int (E_{1,x}^* H_{2,y} - E_{1,y}^* H_{2,x} + H_{1,y}^* E_{2,x} - H_{1,x}^* E_{2,y}) dx ,$$

$$(\mathbf{E}_1, \mathbf{H}_1; \mathbf{E}_2, \mathbf{H}_2)_z = \frac{1}{4} \int (E_{1,y}^* H_{2,z} - E_{1,z}^* H_{2,y} + H_{1,z}^* E_{2,y} - H_{1,y}^* E_{2,z}) dz .$$

Algebraic procedure

- Consistent bidirectional projection at all interfaces
 \longrightarrow linear system of equations in $\{F_{s,m}, B_{s,m}, U_{l,m}, D_{l,m}\}$.
- Influx: $F_0, B_{N_x+1}, U_0, D_{N_z+1} \longrightarrow$ RHS.
- Outflux: $B_0, F_{N_x+1}, D_0, U_{N_z+1}$.

Algebraic procedure

- “Exact” mode profiles \longrightarrow interior problems decouple:

Solve for F_2, \dots, F_{N_z} and B_1, \dots, B_{N_z-1}
in terms of F_1 and B_{N_z} \longrightarrow BEP.

Solve for U_2, \dots, U_{N_x} and D_1, \dots, D_{N_x-1}
in terms of U_1 and D_{N_x} \longrightarrow BEP.

- Continuity of E and H on outer interfaces:

Interior BEP solutions
+ equations at $z = z_0, z_{N_z}, x = x_0, x_{N_x}$
 $\longrightarrow B_0, F_{N_x+1}, D_0, U_{N_z+1}$.

“QUadridirectional Eigenmode Propagation method” (QUEP).

Gaussian beams in free space

$$E_y(x, z):$$

$$n = 1.0, \lambda = 1.0 \mu\text{m},$$

TE polarization,

$$x, z \in [0, 15.1] \mu\text{m},$$

$$M_x = M_z = 150.$$

Top: $4 \mu\text{m}$ beam width, 10° tilt angle, $2 \mu\text{m}$ offset;

Gaussian beams in free space

$$E_y(x, z):$$

$$n = 1.0, \lambda = 1.0 \mu\text{m},$$

TE polarization,

$$x, z \in [0, 15.1] \mu\text{m},$$

$$M_x = M_z = 150.$$

Top: $4 \mu\text{m}$ beam width, 10° tilt angle, $2 \mu\text{m}$ offset;

Gaussian beams in free space

$$E_y(x, z):$$

$n = 1.0$, $\lambda = 1.0 \mu\text{m}$,
 TE polarization,
 $x, z \in [0, 15.1] \mu\text{m}$,
 $M_x = M_z = 150$.

Top: $4 \mu\text{m}$ beam width, 10° tilt angle, $2 \mu\text{m}$ offset;
 bottom: 45° tilt angle, initially centered beams.

Bragg grating: COST268 benchmark problem

(*)
 $d_g = 0.500 \mu\text{m}$,
 $d_e = 0.125 \mu\text{m}$,
 $n_s \approx 1.45$ (SiO₂),
 $n_g \approx 1.99$ (Si₃N₄),
 $n_a = 1.0$,
 $\Lambda = 0.430 \mu\text{m}$,
 $g = \Lambda/2$, $N_g = 20$.

$x \in [-4, 2] \mu\text{m}$, 60 modes (QUEP, BEP $E_y = 0$ b.c.), $z \in [-1.8, 10.185] \mu\text{m}$, 120 modes (QUEP).

Photonic crystal bend

Quadridirectional mode expansion

QUEP scheme:

- Eigenmode expansion technique, 2D Helmholtz problems with piecewise constant, rectangular permittivity.
- Equivalent treatment of the propagation along the two relevant axes.
- Way to realize transparent boundaries for the interior region on a cross-shaped computational domain.
- Basis modes can be restricted to simple Dirichlet boundary conditions.
- Applications: ...
